Supplier Qualification Overview

Evidence for an oral-care OEM supplier review

Company and project identity

ORALABX is the oral-care OEM division of Fuzhou Ruiqi Import & Export Co., Ltd. Confirm the contracting entity, proposed production site, product category and destination market before assessing a supplier package.

Manufacturing evidence to request

Request the proposed site identity, relevant manufacturing licence scope and applicable certificates. Verify the holder, site address, product scope, validity and issuing body. A website logo or broad company claim does not establish that a particular product and site are covered.

Quality and batch evidence

Agree the finished-product specification, release tests, acceptance limits, traceability, retained samples and change-control process. Request project-relevant examples with confidential information removed. Testing scope depends on the formula, packaging, claims and market.

Responsibility split

Identify who approves formula and artwork, who supplies supporting documents, who arranges independent testing, and who holds local market responsibilities. Define formula confidentiality and ownership, permitted changes and complaint handling in the commercial agreement.

Project requirements

Confirm the specification and commercial scope before production.

Buyer qualification checklist

Provide your company and brand, destination markets, intended sales channel, product format, order quantity per SKU, packaging direction and target schedule. Share the current specification when transferring an existing product.

Approval gate

Do not treat the supplier overview as an audit report, product approval or certificate. Confirm the actual site and document set, review samples against the agreed brief, and record unresolved items before approving commercial production.

Commercial starting point

Standard bottled mouthwash, breath spray and toothpaste: 10,000 units per SKU. Single-dose sachets: 100,000 per SKU. Cup formats require a separate review of cup material, sealing film and carton configuration. These are commercial manufacturing programs for established brands, importers and distributors.

Timing and approvals

Initial samples normally take 5-7 working days after the brief and sample scope are agreed. First commercial production normally takes 45-60 days after formula, packaging, artwork and deposit are confirmed. Repeat orders normally take 25-35 days, subject to material availability and the agreed specification. Custom tooling, formulation development and required testing can add time.

Project scope

ORALABX focuses on cosmetic oral-care projects. U.S. OTC drug products are outside scope. Formula, claims, intended users and destination market must be reviewed together before commitments are made. Product registration, notification and market release responsibilities must be agreed with the buyer and relevant local parties.
